Journal Title

Section S1.1   R Code for Consumer-Resource Model

Below is the R code for our model function, which is represented mathematically in the main text in
Equations 1-4. The same code, along with all the code to reproduce our results, has been archived on
Figshare (link) and is available on GitHub (http://github.com/atredennick/Coexistence-Stability/
releases).

```r
simulate_model <- function(seasons, days_to_track, Rmu,
                           Rsd_annual, sigE, rho,
                           alpha1, alpha2, alpha3, alpha4,
                           beta1, beta2, beta3, beta4,
                           eta1, eta2, eta3, eta4,
                           theta1, theta2, theta3, theta4,
                           nu, r1, r2, r3, r4,
                           a1, a2, a3, a4,
                           b1, b2, b3, b4,
                           eps1, eps2, eps3, eps4,
                           D1, D2, D3, D4,
                           N1, N2, N3, N4, R) {

  require('deSolve') # for solving continuous differential equations
  require('mvtnorm') # for multivariate normal distribution functions

  ##  Assign parameter values to appropriate lists
  DNR <- c(D=c(D1,D2,D3,D4),    # initial dormant state abundance
           N=c(N1,N2,N3,N4),    # initial live state abundance
           R=R)                 # initial resource level

  parms <- list (
    r   = c(r1,r2,r3,r4),          # max growth rate for each species
    a   = c(a1,a2,a3,a4),          # rate parameter for Hill function
    b   = c(b1,b2,b3,b4),          # shape parameter for Hill function
    eps = c(eps1,eps2,eps3,eps4)   # resource-to-biomass efficiency
  )
```

```
####
####  Sub-Model functions -------------------------------------------------
####
## Continuous model (Equations 1-2)
updateNR <- function(t, NR, parms){
  with(as.list(c(NR, parms)), {
    dN1dt = N1*eps[1]*(uptake_R(r[1], R, a[1], b[1]))
    dN2dt = N2*eps[2]*(uptake_R(r[2], R, a[2], b[2]))
    dN3dt = N3*eps[3]*(uptake_R(r[3], R, a[3], b[3]))
    dN4dt = N4*eps[4]*(uptake_R(r[4], R, a[4], b[4]))
    dRdt  = -1 * (dN1dt/eps[1] + dN2dt/eps[2] + dN3dt/eps[3] + dN4dt/eps[4])
    list(c(dN1dt, dN2dt, dN3dt, dN4dt, dRdt)) # output as list
  })
} # end continuous function

## Discrete model (Equations 3-4)
update_DNR <- function(t, DNR, gammas,
                       alpha1, alpha2, alpha3, alpha4,
                       eta1, eta2, eta3, eta4,
                       beta1, beta2, beta3, beta4,
                       theta1, theta2, theta3, theta4, nu) {
  with (as.list(DNR),{
    g1    <- gammas[1]
    g2    <- gammas[2]
    g3    <- gammas[3]
    g4    <- gammas[4]
    D1new <- alpha1*N1 + D1*(1-g1)*(1-eta1)
    D2new <- alpha2*N2 + D2*(1-g2)*(1-eta2)
    D3new <- alpha3*N3 + D3*(1-g3)*(1-eta3)
    D4new <- alpha4*N4 + D4*(1-g4)*(1-eta4)
    N1new <- beta1*(1-alpha1)*N1 + g1*(D1+(alpha1*N1))*(1-eta1)
    N2new <- beta2*(1-alpha2)*N2 + g2*(D2+(alpha2*N2))*(1-eta2)
    N3new <- beta3*(1-alpha3)*N3 + g3*(D3+(alpha3*N3))*(1-eta3)
    N4new <- beta4*(1-alpha4)*N4 + g4*(D4+(alpha4*N4))*(1-eta4)
    Rnew  <- theta1*(1-alpha1)*N1 + theta2*(1-alpha2)*N2 +
             theta3*(1-alpha3)*N3 + theta4*(1-alpha4)*N4 +
             nu*R + Rvector[t]
```

```r
    return(c(D1new, D2new, D3new, D4new, N1new, N2new, N3new, N4new, Rnew))
  })
}

##  Resource uptake function (Hill function)
uptake_R <- function(r, R, a, b) {
  return((r*R^a) / (b^a + R^a))
}

##  Generate germination fractions

 } # next season

 return(saved_outs)

} ##  End simulation function
```
Section S1.2 Additional Figures

Figure S1-1 Resource uptake curves for each species (represented by different colors) as used in relative nonlinearity simulations.
Figure S1-2 Variability of community biomass and invasion growth rates of the inferior competitor under different parameter combinations. Points are mean values from 10,000 growing seasons and lines are linear fits to show trends. In **Storage Effect** plots, resource supply is held constant between growing seasons, whereas resource supply varies each year in **Relative Nonlinearity** simulations.
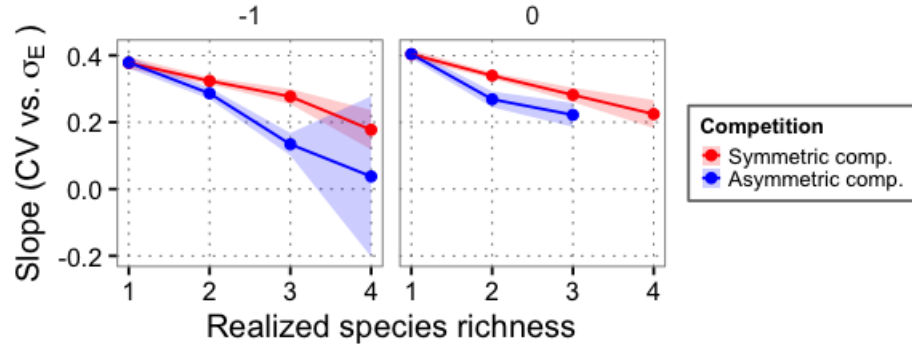

Figure S1-3 Slopes of linear fits for the relationship between $\log(CV)$ and $\log(\sigma_E)$ at different levels of realized species richness from storage effect simulations. The slopes come from linear models fit to log-transformed versions of Figure 3 in the main text. For these simulations, "symmetric competion" (•) refers to similar live-to-dormant biomass allocation fractions ($\alpha = [0.5, 0.495, 0.49, 0.485]$ for the four species), and "asymmetric competition" (•) refers to more dissimilar live-to-dormant biomass allocation fractions ($\alpha = [0.5, 0.49, 0.48, 0.47]$ for the four species).
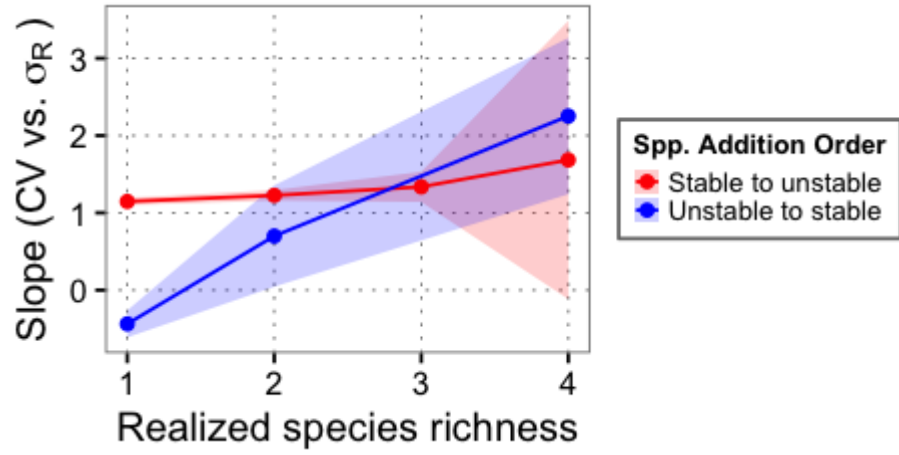

Figure S1-4 Slopes of linear fits for the relationship between $\log(CV)$ and $\log(\sigma_R)$ at different levels of realized species richness from relative nonlinearity simulations. The slopes come from linear models fit to log-transformed versions of Figure 4 in the main text.
